ABSTRACT

This report presents detailed tabulations of data on school enrollment of the civilian noninstitutional population in October 1993. It also includes a summary time series of data collected since the beginning of the survey in 1946. Data cover enrollment in "regular school" from nursery school through college and professional schools. Data are shown by the following characteristics: (1) age; (2) sex; (3) race; (4) Hispanic origin; (5) marital status; (6) family status; (7) family income; (8) education of the householder; (9) labor force status; (10) metropolitan residence; (11) region; and (12) mother's labor force status and education (for preprimary enrollment). Also shown are level and grade of school, public or private schools, full or part-time attendance, and two-year or four-year college. Vocational school enrollment is shown separately. In October 1993 about 65.4 million persons were enrolled in regular school, comparable to the number enrolled in 1992 but over 6 million more than were enrolled a decade earlier. Elementary school enrollment was around 31 million, with high school enrollment at 13.7 million, and a similar number enrolled in college. Included is a U.S. Department of Commerce News press release that discusses changes in school enrollment levels of the nation's race and Hispanic origin groups. Four figures and eight text tables present population characteristics. Nineteen detailed tables and 15 tables in an appendix present additional information. (SLD)

Acknowledgments

This report was prepared in the Education and Social Stratification Branch of the Population Division, under the general direction of **Robert Kominski,** Chief. Overall direction was provided by **Suzanne M. Bianchi**, Assistant Chief, Population Division.

Data collection was conducted by Bureau of the Census field representatives, under the overall direction of **Paula J. Schneider**, former Chief of Field Division. Survey operations and data processing were coordinated by **Ronald R. Tucker** and **James H. Warden** and programming of tabulations was performed by **Randy J. Gardner**, Demographic Surveys Division. **D. Darcel Carter** assisted with table and manuscript preparation. **Janice A. Valdisera** and **Terry A. Lugaila**, Population Division, reviewed the contents of the report. Statistical review and appendix C were provided by **Caroline A. Riker**, Demographic Statistical Methods Division.

The staff of the Administrative and Publications Services Division, **Walter C. Odom**, Chief, provided publication planning, editorial review, design, composition and printing planning and procurement. **Nelsa D. Brown** provided publication coordination and editing.

Dear Colleague:

I am pleased to send you a copy of "School Enrollment--Social and Economic Characteristics of Students: October 1993," our most recent report on school enrollment in the United States, which was released to the public today. The report uses data from the October 1993 Current Population Survey to detail enrollment in nursery school through college by demographic, social and economic characteristics of students and their families. It is part of a series of annual reports begun in 1947.

I hope you will find this report useful in your work; if you or your colleagues need additional copies they are available from the Government Printing Office or this branch directly.

Sincerely,

Paul M. Siegel

CENSUS BUREAU REPORTS CHANGES IN SCHOOL ENROLLMENT LEVELS OF NATION'S RACE AND HISPANIC ORIGIN GROUPS

EMBARGOED UNTIL: NOVEMBER 21, 1994 (MONDAY) - A report released today by the Commerce Department's Census Bureau shows that while the percentage of young African American adults completing high school increased significantly from 1973 to 1993, that group's college enrollment rate did not increase in relation to that of White young adults.

High school completion rates for African Americans rose significantly from 67 percent in 1973 to 75 percent in 1993. There was no change for either Whites (83 percent) or Hispanics (61 percent).

In 1993, 42 percent of White high school graduates (18 to 24 years old) were enrolled in college versus 33 percent of African American high school graduates. The comparable percentages in 1973 were 30 percent for Whites and 24 percent for African Americans.

The college enrollment rate of Hispanic high school graduates was 36 percent in 1993, not statistically different from 1973. (The Hispanic rate in 1993 was not statistically different from that of African Americans.)

According to Rosalind Bruno, author of the report, School Enrollment - Social and Economic Characteristics of Students: October 1993 (P20-479), "Although the difference in the high

(more)

MBARGOED UNTIL: NOVEMBER 21, 1994 (MONDAY)

etion rates is narrowing between African Americans and college enrollment rates are improving for both gap in college enrollment has not decreased."

portion of African American male high school o were attending college did not change significantly and 1993. However, the comparable percentage for ignificantly, so much so that the 1973 difference in ates between African American women and men by 1993. The difference between college enrollment te men and women also disappeared.

ighlights include:

ere was no measurable difference in enrollment rates r White and African American 3- and 4-year-olds in e-primary school, around 40 percent in nursery school d kindergarten. The level of Hispanic children rolled in pre-primary school was significantly lower 27 percent.

er the last two decades, there has been a gnificant increase in minority enrollment at both the ementary and high school levels (21 percent in 73 to 32 percent in 1993) reflecting changes in the neral population. Minority enrollment increased at a ster rate in private schools than in public schools. norities include persons other than non-Hispanic ites.

ong undergraduate college students, about 6 in African Americans and Whites were enrolled in a ur-year college, while only about 5 in 10 Hispanics re enrolled in a four-year college.

out 13 percent of all young adults (18-24 years old) re high school dropouts (not enrolled and not a high hool graduate).

e proportion of African American young adults, aged to 24, who were high school dropouts was only ightly higher than that for Whites (16 vs. percent). Hispanics, however, had a substantially gher dropout rate at 33 percent in 1993.

October 1993, 65.4 million persons were enrolled in rsery school through college, not different from the evious year, but 6.1 million more than a decade fore.

(more)

EMBARGOED UNTIL: NOVEMBER 21, 1994 (MONDAY)

- Elementary school enrollment was 30.6 million in 1993, up from 30.2 million in 1992.
- High school enrollment was 13.7 million persons in 1993, up from 13.3 million in 1992.
- College enrollment was 13.9 million in 1993, not different from the total in 1992. Women accounted for 54 percent of all college students.
- Nursery school enrollment more than doubled from 1973 to 1993, while this population group (persons aged 3 and 4) rose by only 16 percent.
- About 6 in 10 nursery school students were enrolled in a private nursery school, and attendance was directly linked to income of their parents.
- In 1993, one-third of all 3- and 4-year-olds attended nursery school. Of these children, 29 percent had mothers who held at least a bachelor's degree, while only 8 percent had mothers who did not complete high school.

School Enrollment - Social and Economic Characteristics of Students: October 1993

(NOTE: The estimates for 1993 in this report are inflated to national population controls by age, race, sex and Hispanic origin. The population controls are based on results of the 1980 census carried forward to 1993. The estimates in this report, therefore, may differ from estimates that would have been obtained using 1990 census results brought forward to the survey date. Population controls incorporating 1990 census results are used for survey estimation beginning in 1994.

All demographic surveys, including the CPS, suffer from undercoverage of the population. This undercoverage results from missed housing units and missed persons within sample households.

Compared to the level of the 1980 Decennial census, overall CPS undercoverage is about 7 percent. Undercoverage varies with age, sex, and race. For some groups such as 20 to 24 year old Black males, the undercoverage is as high as about 35 percent. The weighting procedures used by the Census Bureau partially correct for the bias due to undercoverage. However, its final impact on estimates is unknown. For details, see appendix C.)

INTRODUCTION

This report presents detailed tabulations of data on school enrollment of the civilian noninstitutional population in October 1993. It also includes summary time series of data collected since the beginning of the survey. The data are from the October school enrollment supplement to the Current Population Survey (CPS). Data on school enrollment have been collected annually in the CPS since 1946 and reported in this publication series. The data cover enrollment in "regular school", which includes nursery school, kindergarten, elementary school, high school, and college and professional school.

Data are shown by the following characteristics: age, sex, race, Hispanic origin, marital status, family status, family income, education of the householder, labor force status, metropolitan residence, region, and mother's labor force status and education (for preprimary enrollment). Also, the following enrollment characteristics are shown: level and grade of school, public/private school, full-time and part-time attendance status, and two-year/four-year college. Vocational school enrollment is shown separately.

HIGHLIGHTS

(Figures shown in parentheses define 90 percent confidence intervals. For details of calculation see "Appendix C, Source and Accuracy of the Estimates.")

- In October 1993, 65.4 (±.6) million persons were enrolled in regular school (nursery school through college), not significantly different from the number enrolled in 1992, but 6.1 (±.8) million more than were enrolled a decade earlier.
- About 7.2 (±.2) million children were enrolled in nursery school or kindergarten in 1993 (3.0 (±.1) million in nursery school and 4.2 (±.2) million in kindergarten), which was not statistically different from the 7.0 (±.2) million enrolled in the fall of 1992.
- Elementary school enrollment (grades 1-8) stood at 30.6 (±.2) million persons, up from 30.2 (±.2) million one year earlier.
- High school enrollment totalled 13.7 (±.1) million persons, up significantly from the 13.3 (±.1) million enrolled in the fall of 1992.
- The annual high school dropout rate (from grades 10-12) for 1993 was not different from 1992 —4.2 (±.6) percent vs. 4.3 (±.6) percent.
- The "dropout pool" (persons not enrolled and not a high school graduate) of young adults 18 to 24 years old totalled 3.1 million (±.1) or 12.7 percent (±.6) of this age group. This was not different, either numerically or proportionately, from the 1992 figure.
- About 13.9 (±.3) million persons were enrolled in college in 1993, not significantly different from the 14.0 (±.3) million enrolled one year before. About 5.6 (±.2) million college students, or 40 percent, were 25 years and over.

SCHOOL ENROLLMENT IN 1993

The Nation's Students

In October 1993, 65.4 million persons were enrolled in regular schools throughout the United States. This total included 3.0 million persons in nursery school, 4.2 million in kindergarten, 30.6 million in elementary school, 13.7 million in high school, and 13.9 million in college (not different from the number enrolled in high school). The total of 65.4 million students was not significantly larger than the 64.6 million enrolled in 1992. It was a sizable increase over the 59.3 million regular school students reported in 1983 and the 60.2 million reported in 1973.

Table A. **School Enrollment by Level: 1993, 1983, and 1973**

[Numbers in thousands]

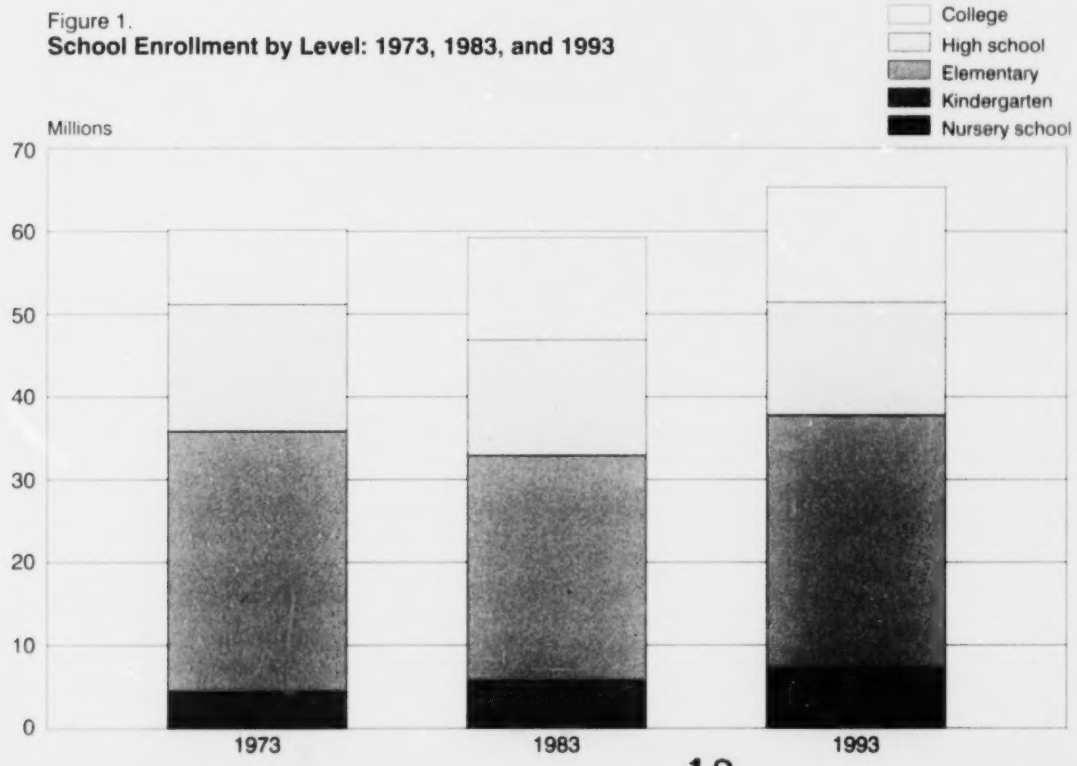
Level	1993	1983	1973	Change 1973-1993	
				Number	Percent
All students..	65,363	59,239	60,179	5,184	8.6
Nursery school.	3,018	2,350	1,324	1,694	127.9
Kindergarten...	4,180	3,361	3,074	1,106	36.0
Elementary	30,615	27,198	31,469	(854)	-2.7
High school....	13,653	14,010	15,347	(1,694)	-11.0
College	13,898	12,320	8,966	4,932	55.0

Table A and figure 1 show the distribution of students at various levels of school in 1993, 1983 and 1973. While elementary and high school enrollment are largely affected by population trends, preprimary and college enrollment are affected by changes in enrollment rates as well as population trends. Nursery school enrollment more than doubled from 1973 to 1993, while the eligible age group rose by only one-sixth. College enrollment rose by half, in spite of declines in the traditional college age population throughout the 1980's and 1990's.

Preprimary Enrollment

About 55.1 percent (6,581,000) of children ages 3 to 5 years old were enrolled in preprimary school in the fall of 1993. Among children 3 and 4 years old, 40.4 percent were enrolled, most of them in nursery school (2.7 million of 3.3 million total enrollees). There was no measurable difference in enrollment levels for White 3- and 4-year-olds (40.8 percent) and Black 3 and 4-year-olds (39.8 percent), but the level for Hispanic children (who may be of any race) was significantly lower (26.8 percent). Given the availability of public kindergarten in all states, the vast majority of 5-year-olds were enrolled in school (91.8 percent), most in kindergarten (79.2 percent). There was no difference between the three race and ethnic groups in the proportion of 5-year-olds enrolled (table 3).

Figure 1.
School Enrollment by Level: 1973, 1983, and 1993



National Education Goal #1 states that "all children in America will start school ready to learn."[1] Aside from learning activities at home, the best preparation for school is experience in a successful nursery school or preschool program. Since nursery school is not part of the regular public school system, it is not available to all children. Many nursery schools are privately operated with tuition levels that are prohibitive for low income families. As one would expect, attendance is linked to income (table B). However, public programs such as Head Start, which is targeted at low income families and funded by the U.S. Department of Health and Human Services, and specific programs in some urban school systems, allow large numbers of lower income students to attend preschool or nursery school. About 23.9 percent of children 3 and 4 years old in families with less than $20,000 income and 49.9 percent of those in families with incomes of $40,000 or more attended nursery school. Three-fourths of the nursery school students in low income families but one in five of those in high income families attended public schools.

[1]May be of any race

Table C shows that Black 3- and-4-year-olds were only slightly less likely to be enrolled in nursery school than were White children (29.5 percent vs. 34.9 percent). Black children were more likely than White children to be in public programs (74.6 percent compared with 33.4 percent). About 16.5 percent of Hispanic origin 3- and 4-year-olds were enrolled in nursery school, 70.4 percent of them in public schools (not different from Black nursery school students).

For White children, enrollment was primarily part day and private. For Black children it was primarily full day and public. Half of the increase in nursery school enrollment from 1973 to 1993 was in the public sector. Over time, the proportions in public schools increased for Whites from 20.9 to 33.4 percent (table C), but it remained at about 75 percent for Black students. The proportion attending full day also increased for Whites, from 23.1 percent to 30.6 percent, while the proportion remained at about 60 percent full day for Black children.

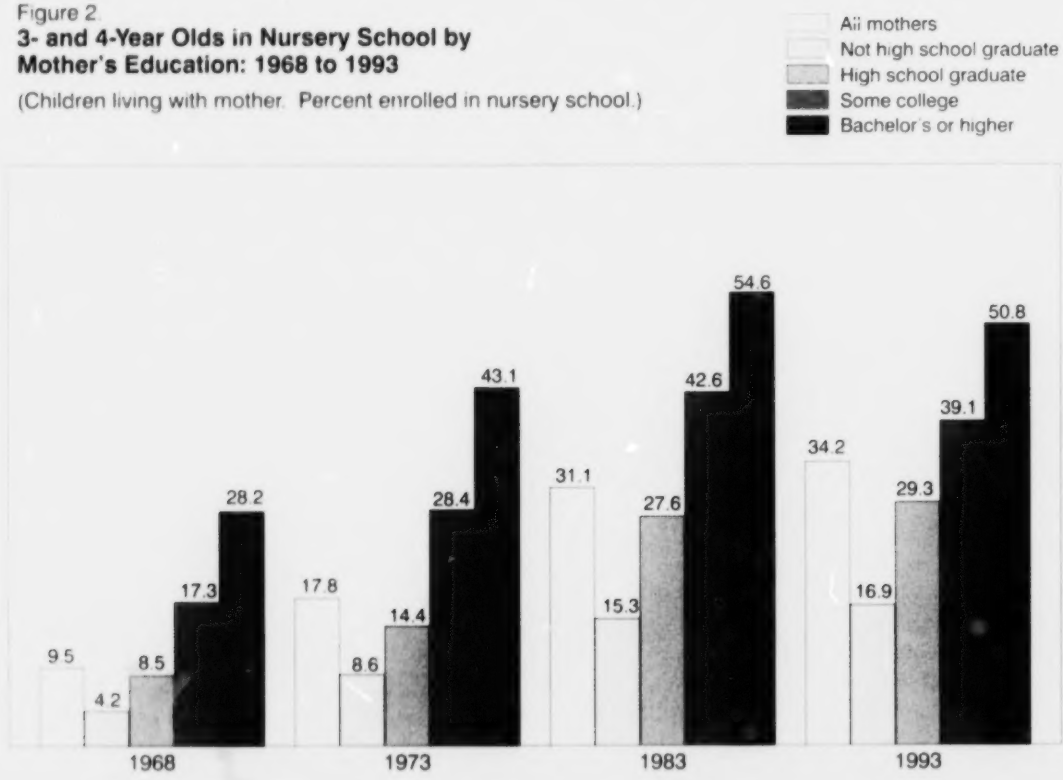
The proportion of 3- and-4-year-olds who attended nursery school in 1993 was over three times the proportion recorded 25 years before, when the data were first available (33.7 percent vs 9.5 percent). This change can be related to changes within the family —changes in education levels and labor force participation of mothers. It is clear that the probability of a child attending nursery school is directly related to the mother's education. Children of mothers who were college graduates were substantially more likely than others to attend school in each year shown in figure 2. The proportions were 28.2 percent in 1968 and 50.8 percent in 1993. Only 4.2 percent of children whose mothers were not high school graduates attended nursery school in 1968, compared with 16.9 percent in 1993.

Over time, the education of mothers has increased, as has nursery school attendance. There was a substantial increase in the proportion of children with mothers who had bachelor's degrees, from 7.6 percent in 1968 to 19.4 percent in 1993, and a decrease in the proportion whose mothers were high school dropouts (from 35.2 to 16.7 percent). The increase in educational attainment of mothers can further be associated with the increased labor force participation rate of mothers and increased nursery school enrollment of their children.

As the education levels of mothers increased so did their labor force participation rates. The proportion of all 3-and-4-year-olds whose mothers were in the labor force rose from 31.3 percent to 58.2 percent from 1968 to 1993. Children whose mothers were in the labor force were somewhat more likely to attend nursery school than those whose mothers were not in the labor force. About 37.0 percent of those whose mothers were in the labor force and 30.2 percent of those whose mothers were not in the labor force attended nursery school.

Figure 2.
3- and 4-Year Olds in Nursery School by Mother's Education: 1968 to 1993

(Children living with mother. Percent enrolled in nursery school.)



A larger difference between children whose mothers were in the labor force and those whose mothers were not in the labor force may be found in the proportions attending school full day. The majority of nursery school students attended part day, 64.7 percent in 1993. However, since full-day nursery school can also serve as child care, children of mothers in the labor force were much more likely than others to attend full day (43.5 percent vs 20.3 percent of all children enrolled).

Elementary and Secondary School Enrollment

Five very basic questions about elementary and high school enrollments and their changes can be answered with the CPS data: (1) What are the general elementary and high school enrollment levels? (2) How many students attend public and private schools? (3) What is the racial and ethnic distribution of public and private school students? (4) Are children falling behind in school? (5) What is the national high school dropout rate?

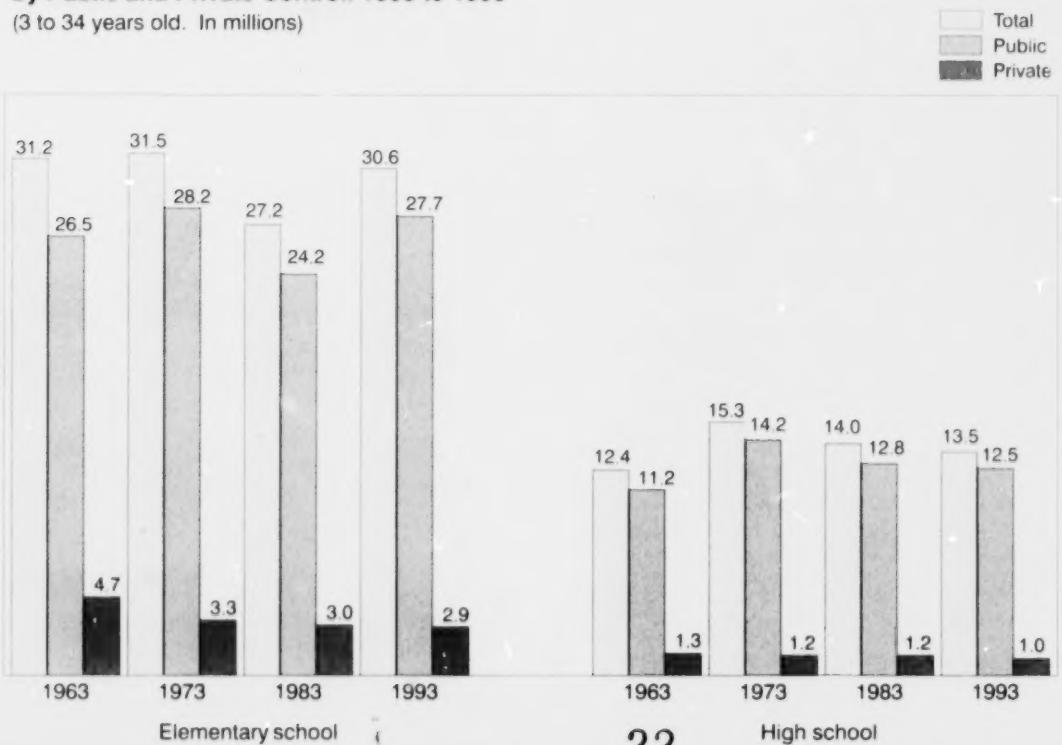
Current and Future Enrollment Levels. There were 30.6 million persons enrolled in elementary school (grades 1 through 8) in the fall of 1993, up from 30.2 million in 1992. About 13.7 million persons were enrolled at the high school level (grades 9 through 12) in 1993, an increase from the 13.3 million enrolled in 1992.

Total enrollment in grades 1 to 12 was only slightly different in 1993 from enrollment thirty years before (Figure 3). In 1993 there were 44.1 million students (3 to 34 years old), compared with 43.7 in 1963. In the intervening period total enrollments had been both higher and lower. In 1973 as many as 46.8 million students were enrolled, whereas in 1983 the figure was only 41.2 million. Table A-1 shows single year estimates at all levels. Since changes in elementary and high school enrollment are primarily a result of changes in births in earlier years, the fluctuations in total enrollment mask more significant changes at each level, as larger and smaller cohorts progress through the 12 years of schooling.

Given the near-universal nature of schooling for young persons, the number of persons enrolled in elementary school closely parallels the size of the population 6 to 13 years of age. During the 1970's and early 1980's, elementary school enrollments fell, reflecting the general decrease in the size of the 6- to 13-year-old population. As figure 3 shows, elementary school enrollment was lower in 1993 than in 1963 and 1973. High school enrollment was higher in 1993 than in 1963 but lower than the 1973 and 1983 levels. During the late 1970's and 1980s, the number of persons in high school fell as the size of the population ages 14 to 17 declined.

The gradual entrance and exit of the "baby boom" cohort (born between 1946 and 1964) from the school age population had the greatest effect on enrollment

Figure 3.
Elementary and High School Enrollment by Public and Private Control: 1963 to 1993
(3 to 34 years old. In millions)



numbers. The earliest of the group entered elementary school in about 1952. The full effect of the baby boom's entry into school did not reach intermediate grades and high school until several years later. The baby boom began entering high school around 1960. As the baby boom cohort moved through the system, they were followed by cohorts from lower birth years, sometimes referred to as the "baby bust." By the mid 1980's those born in higher birth years of the "echo boom" entered school.[2] Elementary enrollment peaked in the period 1968 to 1970, then declined to a low in 1983 to 1985, as the 6-to-13-year-old population declined. After that, enrollment began to grow. High school experienced peaks and valleys a few years later than elementary school. It peaked in 1975-1977 and reached a trough in 1989-1990. As of 1993, both levels were increasing slowly.

This trend is expected to continue for both groups in the near-term. The current projection of the population for children ages 6 to 13 for the year 2000 is 32.5 million. If existing enrollment rates for this age group continue, there will be over 2 million more elementary students in 2000 than in 1993. Projections of 14-to-17-year-olds indicate that high school enrollments will continue to rise throughout this decade, if enrollment rates remain the same.[3]

Public and Private School Enrollment. In 1993, 9.5 percent of elementary students and 7.3 percent of high school students were enrolled in private schools. Thirty years before, 15.2 percent of elementary students and 10.1 percent of high school students attended private schools. In the 30 year period, public and private enrollments followed different paths. While total enrollment grew by only 1.0 percent, private school enrollment dropped 35.1 percent and public school enrollment grew 6.7 percent. While total enrollment reflected total population trends, private school enrollment trends have been generally downward. Private school enrollment began to decline in the mid 1960's. One of the largest factors in the decline in private school enrollments was the decline in Catholic school attendance. In the mid 1960's about 7 of 8 private school students were in Catholic schools. In 1993 Catholic schools accounted for about 57.3 percent of all private school enrollment.[4]

Racial and Ethnic Composition of Student Population. As figure 4 shows, in 1993 slightly more than two-thirds of elementary and high school enrollment was composed of White nonHispanic students[5] compared with slightly more than three-fourths twenty years earlier. Figure 4 and table D show that from 1973 to 1993 Black students rose from 13.9 to 15.8 percent of all elementary and high school enrollment. Similarly, Hispanic students rose from 5.8 to 11.9 percent and students of other races from 1.4 to 4.8 percent of all elementary and high school students.

Total minority enrollment (persons other than White nonHispanic) rose from 21.2 to 32.4 percent of all students. Table D shows that minority enrollment in public schools rose from 22.2 percent to 33.5 percent and in private schools from 11.8 percent to 21.4 percent. Minority enrollment increased more in private schools than public schools.

Over the years 1963 to 1993, the proportion of White students (including Hispanic origin) enrolled in private schools dropped significantly from 15.2 to 9.6 percent. For Black students there was a slight increase in the same period, from 4.2 percent (for Black and other races in 1963) to 5.4 percent in 1993.

Modal Grade. A new time series table has been added to appendix A, table A-3, which shows for the school age population (6 to 17 years) the proportion of persons enrolled below the modal grade for their age, in four age groups. There will always be some children enrolled below modal grade because children do not all start school at the same age. State laws differ on minimum enrollment age and some parents choose to start their children later. State laws have also been changing in recent years to move the cut off date forward in many States.[6] This is seen in the youngest age group where about 18.7 percent of children were enrolled below the modal grade at the survey date.

The points of interest are: What proportion of students are retained in grade at some point in their elementary and high school career? Is grade retention more likely to occur at specific stages of an academic career? Has the proportion retained changed? What proportion begin school below modal grade? How do population groups differ?

In 1993, 32.0 percent of 15-to-17-year-olds were enrolled below the modal grade for their age and 18.7 percent of 6-to-8-year-olds were below mode for their age. The birth cohort aged 15 to 17 years in 1993 was 6 to 8 years old in 1984 and was 16.6 percent below model grade in 1984. Therefore, 15.4 percent were retained in grade between 1984 and 1993. Most retentions appeared to have occurred early in elementary

[2]The "echo boom" is defined by the large increase in births beginning around 1977, which was due primarily to the entrance of "baby boom" women (born 1946-1964) into their prime childbearing years)

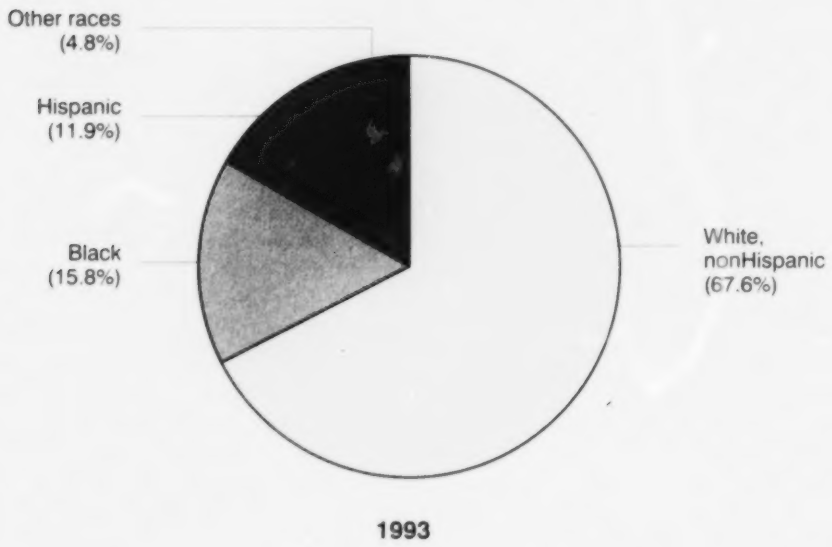
[3]Current Population Report, Series P25-1104, *Population Projections of the United States by Age, Sex, Race, Hispanic Origin: 1993 to 2050.* Middle series are used for all projections in this report.

[4]National Catholic Educational Association.

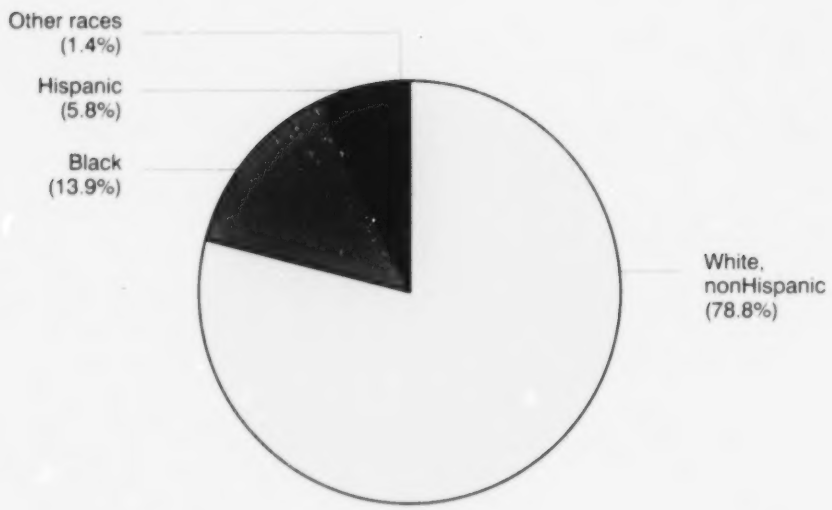
[5]NOTE: White non-Hispanic was estimated by subtracting the Hispanic origin population from the White population. In this survey over 95 percent of persons of Hispanic origin are also classified as White race.

[6]According to the Education Commission of the States, in 1979 only 9 States had a birth month cutoff for entry before October 1, by 1992, 19 States had a cutoff prior to October 1.

Figure 4.
Elementary and High School Enrollment, Racial and Ethnic Distribution: 1993 and 1973



1993



1973

schools, the largest increase occurred by ages 9 to 11 years, when 26.7 percent were enrolled below modal grade. The earliest cohort that could be traced, 6 to 8 years old in 1971 and 15 to 17 years old in 1980 showed 11.1 percent below modal grade at the youngest age, in 1971, and 22.5 percent below modal grade in 1980. Over the years shown in table A-3, from 1971 to 1993, the proportion below modal grade has increased for each age group.

How do groups differ? Boys have been starting school a little later than girls. More male children were below mode at age 6 to 8 years than females, 21.1 percent vs. 16.1 percent in 1993. Males have a significantly higher rate of retention in intervening years. By age 15 to 17 in 1993, 38.7 percent of males and 24.9 percent of females were below modal grade. White, Black, and Hispanic students were not significantly different in the proportion of the youngest cohort below mode in 1993. Of 15- to- 17- year-olds in 1993, however, 29.7 percent of Whites, 43.3 percent of Blacks, and 38.3 percent of those of Hispanic origin were enrolled below the mode. (The latter two were not significantly different.) The largest difference between age groups was between 6-to-8-year-olds and 9-to-11-year-olds, indicating that grade retention is most likely to occur in early years of school.

High School Dropouts. The annual high school dropout rate has declined overtime. During the one year period from October 1992 to October 1993, about 382,000, or 4.2 percent, of all students in the 10th, 11th, or 12th grade dropped out of high school.[7] While this overall national annual dropout rate is considerably lower than the level of 5.2 percent just ten years earlier (see table A-4), in recent years there have not been significant changes.

There is some variation among subpopulations. The data in table E show that the high school dropout rates of Whites (4.1 percent), Blacks (5.4 percent) and persons of Hispanic origin (6.4 percent) were not statistically different from each other. The rates for men and women, at 4.4 and 4.1 percent, respectively, also were not statistically different from each other. Across family income groups there were differences in the dropout rate, however. While 7.5 percent of high school students from families with incomes below $20,000 dropped out of high school in the past year, just 1.5 percent of those from families with incomes of $40,000 or more left

[7]The annual high school dropout rate was first presented in Current Population Reports, Series P20-413, *School Enrollment—Social and Economic Characteristics of Students: October 1983.* Details of its calculation are presented in that report, as well as in Appendix B, Definitions and Explanations, of this report.

Table D. **Elementary and High School Enrollment by Type of School and Ethnicity: 1993, 1983, and 1973**

[Numbers in thousands. Persons 3 to 34 years old]

Year, race and ethnic group	Elementary and high school			Percent private	Percent of total enrolled		
	Total	Public	Private		Total	Public	Private
1993							
All groups	44,125	40,230	3,893	8.8	100.0	100.0	100.0

White, nonHispanic	36,904	32,984	3,926	10.6	78.8	77.9	88.2
Black	6,517	6,265	252	3.9	13.9	14.8	5.7
Hispanic	2,718	2,489	223	8.2	5.8	5.9	5.0
Other races	677	625	51	7.5	1.4	1.5	1.1
1963							
All races	43,683	37,688	5,993	13.7	100.0	100.0	100.0
White	37,703	31,963	5,739	15.2	86.3	84.8	95.8
Black and other races	5,980	5,725	254	4.2	13.7	15.2	4.2

Note: White, nonHispanic was derived by subtracting Hispanic population from White. See text.

school before graduation. In addition, there were differences by grade —2.6 percent of 10th grade students dropped out compared with 7.5 percent of 12th graders.

An alternative measure of high school dropouts is the proportion of persons who are no longer enrolled and have not completed high school. This "dropout pool" is, to some extent, a summary of the year-to-year dropout rates (and re-enrollment) over the life of a cohort. Data from table A-5 show that among persons 18 to 24 years old, 3.1 million (12.7 percent) were high school dropouts in 1993; this is a significant decrease from the level ten years earlier when it was 4.4 million or 15.4 percent. Men and women were not different in their proportions of dropouts in 1993 (13.2 vs. 12.2 percent). A somewhat higher proportion of Blacks than Whites were dropouts (16.4 vs. 12.2 percent). The level for Hispanics was substantially higher than both at 32.7 percent. Data from table 2 show that the dropout proportion was considerably lower among young persons in suburbs of metropolitan areas (11.0) than among those in central cities (14.9) or nonmetropolitan areas (13.1), which were not significantly different from each other.

Table E. **Annual High School Dropout Rates: October 1993**

Characteristic	Percent
Total	4.2
Male	4.4
Female	4.1
White	4.1
Black	5.4
Hispanic origin[1]	6.4
Family income	
Less than $20,000	7.5
$20,000 and $39,999	3.5
$40,000 and over	1.5
10th grade	2.6
11th grade	3.1
12th grade	7.5

[1]May be of any race.

High School Graduation and Access to College

One of the goals of the education community is equitable access to higher education for all persons. The first step in meeting this goal is equity in high school graduation rates. Tables F and A-5 show the proportions of young adults who have completed high school and the proportions of those high school graduates who go on to college. In the 20 years these data have been available for all groups, both the proportion of 18-to-24year-olds who were high school graduates and the proportion of those graduates enrolled in college has increased. In 1993, 82.0 percent of all 18- to-24-year-olds were high school graduates and 41.4 percent of those graduates were enrolled in college. In 1973, the comparable figures were 80.7 percent and 29.7 percent respectively.

The increase in high school graduation over the past 2 decades was substantial for the Black population, increasing from 66.8 percent in 1973 to 74.8 percent in 1993, but there was no change for Whites (83.4 percent in 1993). The gap between the two groups was cut significantly, to 8.6 percentage points. For Hispanics there was not a statistically significant improvement. Their high school completion rate remained far below the other groups at 60.7 percent. Correspondingly, the proportion of persons in the age group who were high school dropouts improved for all 3 groups: from 26.5 to 16.4 percent for Blacks, 14.2 to 12.2 percent for Whites, and 38.9 to 32.7 percent for Hispanics. Although differences between the 3 groups remained, the gap between Blacks and Whites had narrowed. These data are shown in table A-5 for each year, but year to year comparisons do not yield statistically significant differences for small groups. While the sample size is not large enough to detect small changes in the data, longer term trends, such as those shown in table F, are more reliable.

In 1993 men and women were not different in the proportion of high school graduates who were enrolled in college (41.9 vs. 41.0 percent respectively). Twenty years earlier enrollment rates were higher for men (34.6 vs. 25.3 percent). The college enrollment rate rose more for women than for men.

In the twenty year period, college enrollment rates increased for both genders and both race groups. However, while the difference in enrollment rates between women and men disappeared, the difference between races remained and Blacks did not improve their position relative to Whites (table F). In 1993 there was a 9.0 percentage point difference between race groups, with 41.8 percent of White high school graduates and 32.8 percent of Black high school graduates enrolled in college.

For Black males the proportion who were high school graduates rose substantially, from 66.4 to 72.8 percent from 1973 to 1993, but there has not been a significant change in the proportion of high school graduates attending college. The potential college pool has increased because high school graduates are a larger proportion of the age group. The college enrollment rate of those graduates has not improved significantly. The apparent change from 27.9 to 31.4 percent is not statistically significant. For Black females, as for White females, both high school completion and college enrollment rose significantly. The college enrollment rate of females had been significantly below that for males in both groups, but in 1993 there was no difference between men and women of either group.

For the Hispanic origin population there has not been much change. The apparent small increases in both

rates during the twenty year period are not statistically significant, given the small sample size for Hispanics in this survey.

College Enrollment

In October 1993, 13,898,000 persons were enrolled in colleges across the nation; this was statistically unchanged from the 14,035,000 persons who were enrolled in the fall of 1992. While the "traditional" college age population (persons 18 to 24 years old) declined by 4.5 million persons in the past ten years, the number of college students rose by 1.6 million, largely reflecting the increase in college enrollment among persons ages 25 and older, as well as higher enrollment rates of the traditional college age population.

Table G details some of the basic characteristics of college students in 1993, and illustrates the diverse nature of the college population. As can be seen in the age detail, 4 in 10 of all college students were age 25 or older. In 1973, students 35 years old and over were just 8.8 percent of all college students; by 1983 this had risen to 12.1 percent; and in 1993 it stood at 17.9 percent (table A-6).

Women accounted for 54.5 percent of all college students in 1993, continuing the majority position they have occupied since 1979. Just twenty years earlier, women constituted only 43.7 percent of all college students. The age and gender data illustrate the fact that much of the older student enrollment is enrollment by women. In 1993, among students 25 and over, 6 of 10 were women. Among all college students, women were more likely than men to be enrolled in a two-year college and more likely to be in a public college or university.

The majority of students (64.9 percent) were enrolled full-time, and 78.5 percent were enrolled in a public college or university. Of the 11.5 million students enrolled at the undergraduate level, 63.5 percent were enrolled in four-year institutions. Among undergraduates 63.6 percent of Whites and 61.1 percent of Blacks (not significantly different from each other) were in four-year colleges or universities compared with 50.3 percent of Hispanics. Finally, 59.7 percent of all college students were employed either full or part time, 43.9 percent of students under 20 years old (mostly part-time) and 69.9 percent of the oldest students, 35 years and over (mostly full-time).

For many persons, college enrollment must be negotiated not only with respect to financial cost, but among many life-cycle factors as well, such as marriage, building a family and establishing a career. Table H shows the proportion of students, by age, attending full-time at two-year and four-year institutions. In general, a much

35 years old and over	2,488	28.6	844	30.3	789	34.3	856	21.5

larger proportion of students at four-year colleges attend full- time, but there is also a strong relationship between age and full-time attendance. While 90.4 percent of traditional age college students enrolled in four-year colleges attended full-time, only 30.3 percent of students 35 years and over in two-year colleges attended full time.

DATA FILES AVAILABLE

The time series tabulations of enrollment shown in Tables A- 1 through A-7 in appendix A are now available on two floppy diskettes. The tables are available as either seven ASCII print files, or seven LOTUS 1-2-3 © files (version 2.1). Users wishing to purchase files should specify which data format they prefer (ASCII or LOTUS), include a check for $25 (make checks payable to "Commerce-Census") and send to:

Note: Data for 1947 to 1953 exclude kindergarten. Nursery school was first included in 1964. 1986 data are shown for the old and new processing system. Improvements in edits and population estimation procedure caused slight changes in the estimates.

[r]Revised
[1]Data are for Black and other races.
[2]Data are adjusted to include Black only.
[3]Persons of Hispanic origin may be of any race.

Notes: Data for 1980 and all later years use 1980 Census-based estimates. 1986 data are shown for the old and new processing system. Improvements in edits and population estimation procedures caused slight changes in the estimates.

Note: The change in the educational attainment question and the college completion categories from "4 or more years of college", to "at least some college," in 1992 caused an increase of approximately 5 percentage points in the proportion of 14-to-24-year-old high school graduates enrolled or completed one or more years of college.

'Revised

[1]High school graduates are persons who have completed 4 years of high school or more, for 1967 to 1991. Beginning in 1992, they were persons whose highest degree was a high school diploma (including equivalency) or higher.

[2]Persons of Hispanic origin may be of any race.

Note: 1986 data are shown for the old and new processing system. Improvement in edits and population estimation procedure caused slight changes in the estimates. Data for 1947 and 1955 to 1970 are for persons 14 to 34 years old. Data for 1950 are for persons 14 to 29 years old.

'Revised.
[1]Data for 1955 to 1963 are for Black and other races.
[2]Persons of Hispanic origin may be of any race.

Appendix B. Definitions and Explanations

Population coverage. The figures in this report for October 1993 are sample survey data and related to the civilian noninstitutional population of the 50 States and the District of Columbia. The estimation procedure used for this survey involves the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, sex, race, and Hispanic origin. These independent estimates are based on civilian noninstitutional population counts from the decennial censuses and are updated with statistics on births, deaths, immigration, and emigration and statistics on the strength of the Armed Forces. Data published for 1972 through 1980 were based on independent population estimates derived by updating the 1970 decennial census counts. Starting with the data collected in the October 1981 Current Population Survey (CPS), independent estimates were based on civilian noninstitutional population controls for age, race, and sex established by the 1980 decennial census. The April 1980 census population count differed somewhat from the independent estimates for April 1980 derived by updating 1970 census population figures. The April 1980 census count of the civilian noninstitutional population was 222,420,441, compared with the 1970 census-based figure of 217,400,244 used for the CPS. Basically, this difference had little impact on summary or proportional measures, such as medians and percent distributions; however, use of the new controls could have had significant effect on the absolute numbers.

School enrollment. The school enrollment statistics from the current survey are based on replies to the interviewer's inquiry whether the person was enrolled in regular school. Interviewers were instructed to count as enrolled anyone who had been enrolled at any time during the current term or school year in any type of public, parochial, or other private school in the regular school system. Such schools include nursery schools, kindergartens, elementary schools, high schools, colleges, universities, and professional schools. Attendance may be on either a full-time, or part-time basis and during the day or night. Regular schooling is that which may advance a person toward an elementary or high school diploma, a college, university, or professional school degree. Children enrolled in nursery schools and kindergarten are included in the enrollment figures for regular schools and are also shown separately.

Enrollment in schools which are not in the regular school system, such as trade schools, business colleges, and schools for the mentally handicapped, which do not advance students to regular school degrees, is not included.

Persons enrolled in classes which do not require physical presence in school, such as correspondence courses or other courses of independent study, and in training courses given directly on the job, are also excluded from the count of those enrolled in school, unless such courses are being counted for credit at a regular school.

Level of school. The statistics on level of school indicate the number of persons enrolled at each of five levels—nursery school, kindergarten, elementary school (1st to 8th grades), high school (9th to 12th grades), and college or professional school. The last group includes graduate students in colleges or universities. Persons enrolled in elementary, middle school, intermediate school or junior high school through the eighth grade are classified as in elementary school. All persons enrolled in 9th through 12th grade are classified as in high school.

Nursery school. A nursery school is defined as a group or class that is organized to provide educational experiences for children during the year or years preceding kindergarten. It includes instruction as an important and integral phase of its program of child care. Private homes in which essentially custodial care is provided are not considered nursery schools. Children attending nursery school are classified as attending during either part of the day or the full day. Part-day attendance refers to those who attend either in the morning or in the afternoon, but not both. Full-day attendance refers to those who attend in both the morning and the afternoon.

Head Start. Children enrolled in Head Start programs or similar programs sponsored by local agencies to provide preschool education to young children are counted under nursery school or kindergarten as appropriate.

Public or private school. In this report, a public school is defined as any educational institution operated by publicly elected or appointed school officials and supported by public funds. Private schools include educational institutions established and operated by religious

bodies, as well as those which are under other private control. In cases where enrollment was in a school or college which was both publicly and privately controlled or supported, enrollment was counted according to whether it was primarily public or private.

Modal grade. Enrolled persons are classified according to their relative progress in school: that is, whether the grade or year in which they were enrolled was below, at, or above the modal (or typical) grade for persons of their age at the time of the survey. The modal grade is the year of school in which the largest proportion of students of a given age is enrolled.

Annual High School Dropout Rate. The annual high school dropout rate is an estimate of the proportion of students who drop out of school in a single year. Table A-4 presents estimates of the annual dropout rate for various groups since 1967. This section briefly explains

Basic School Enrollment Supplement

(Questions included in the October CPS since 1967)

how the annual dropout rate is calculated; for further explanation and details of its derivation see CPR Series P-20, No. 413, School Enrollment—Social and Economic Characteristics of Students: October 1983.

Annual dropout rates for a single grade(x) are estimated as the ratio of the number of persons who were enrolled in grade(x) in the year preceding the survey, did not complete grade(x) and are not currently enrolled, to the number enrolled in grade(x) at the start of the year preceding this survey. Persons reported as enrolled last year but not currently enrolled are presented in table 8 by the highest grade completed and are presumed to have dropped out of the succeeding grade (except those who graduated this year). Thus, individuals counted as 10th grade dropouts are those not enrolled in school whose highest grade completed is the 9th grade. (They include not only those persons who were enrolled in the 10th grade in the fall of the year preceding the survey and left school without completing the year, but also those persons who finished the 9th grade in the spring preceding the survey and were not enrolled at the survey date.) These estimates form the numerator of estimates of the annual grade specific dropout rate.

Persons currently enrolled in high school are presumed to have successfully completed and been enrolled in the preceding grade in the preceding year. Thus, those who have successfully completed the 10th grade are enrolled in the 11th grade. Along with the persons who dropped out of that grade, they comprise the denominator of the estimate of the annual grade-specific dropout rate.

$$\text{Dropout from grade } n = \frac{\text{Not enrolled and highest grade completed} = n\text{-}1}{\text{Enrolled in grade } n+1 + \text{Not enrolled and highest grade completed} = n\text{-}1}$$

Since persons who complete the 12th grade cannot be presumed to enroll in college, the estimate of the number of persons enrolled in the 12th grade one year prior to the survey is constructed as the sum of the number of persons reported as having graduated from high school "this year" in table 8 (both those enrolled in the first year of college and persons not currently enrolled whose highest grade completed is the 12th grade) and those persons not currently enrolled who were enrolled last year and whose highest grade completed is the 11th grade (dropouts).

The annual dropout rate for all grades during one year can be obtained by summing the components of the rates for the individual grades. In other words, those persons who were enrolled in the tenth, eleventh, or twelfth grade last year and who are not currently enrolled and do not have a diploma. The following chart shows the components of the annual dropout rate calculation for each grade.

Dropped out of grade	Numerator	Denominator	
	Not currently enrolled and highest grade =	Current grade in which enrolled =	Not currently enrolled and highest grade =
10	9	11	9
11	10	12	10
12	11	College 1 + (not enrolled, completed 12 and graduated this year)	11

In addition to the annual rate, two other estimates of dropouts are frequently used. The annual dropout rate is different from a "pool" (or status) measure such as the proportion of an age group who are high school dropouts (not enrolled in school, not high school graduates, shown in table 1), which does not depend on when the individuals dropped out.

A third measure of dropouts is the cohort measure, most commonly from a longitudinal study, in which one calculates the proportion of a specific group of people enrolled in a specific year, who had not received diplomas (and who were no longer in school) some years later. For example, the proportion of a cohort enrolled in ninth grade in year X, who were not enrolled and had not received a diploma by year X+4.

College enrollment. The college enrollment statistics are based on replies to the interviewer's inquiry as to whether the person was attending or enrolled in college. Interviewers were instructed to count as enrolled anyone who had been enrolled at any time during the current term or school year, except those who have left for the remainder of the term. Thus, regular college enrollment includes those persons attending a 4-year or 2-year college, university, or professional school (such as medical or law school) in courses that may advance the student toward a recognized college or university degree (e.g., BA or MA). Attendance may be either full time or part time, during the day or night. The college student need not be working toward a degree, but he/she must be enrolled in a class for which credit would be applied toward a degree. (see "school enrollment")

Two-year and four-year colleges. College students were asked to report whether the college in which they were enrolled was a 2-year college (junior or community college) or a 4-year college or university. Students enrolled in the first 4 years were classified by the type of college they reported. Type of college is shown in tables for undergraduates only. Graduate students are shown as a separate group.

Revisions in processing and tabulations have resulted in data not strictly comparable to that published for earlier years. In tabulations for years prior to 1987, students in the fourth academic year of college were

assumed to be in a 4-year college or university regardless of the type of college they reported (74,000 fourth-year students were reported enrolled in 2-year colleges in 1986 on the questionnaire but included in 4-year colleges in the tabulations). Also before 1987, type of college was not allocated for students who did not report (about 250,000 students in the first to third year in 1986). Revised edit and allocation procedures for 1987 and 1988 increased the estimated number of college students, which also increased the numbers of persons reported in 2-year and 4-year colleges. The following table shows data for 1986 using both the revised and old processing and tabulation systems. The differences are due to procedural changes rather than real change:

Undergraduates (X 1000)	Revised	Old	Difference
14 to 34 years old	9,098	8,972	126
2-year college	3,087	2,831	256
4-year college	6,011	5,892	119
Type not reported	000	249	-249

Full-time and part-time attendance. College students were classified, in this report, according to whether they were attending school on a full-time or part-time basis. A student was regarded as attending college full time if he/ she was taking 12 or more hours of classes during the average school week, and part time if he/ she was taking less than 12 hours of classes during the average school week.

School enrollment in year preceding current survey. An inquiry on enrollment in regular school or college in October of the preceding year was asked for all persons (enrolled and not enrolled). In years before 1988, the question was asked only of persons who were not currently attending regular school or were enrolled in college. In the tabulations of persons enrolled in secondary school in the previous year, persons currently enrolled in high school are assumed to have been enrolled the previous year.

Vocational school enrollment. Vocational school enrollment includes enrollment in business, vocational, technical, secretarial, trade, or correspondence courses which are not counted as regular school enrollment and are not for recreation or adult education classes. Courses counted as college enrollment should not also be included as vocational.

Comparability of enrollment data in previous years. Changes in the edit and tabulation packages used in processing the October CPS school enrollment supplement have caused some minor revisions in the estimates. The current edit and tabulation package began with 1987 data. The 1986 data which were published in CPR series P-20 No. 429, were reprocessed with the rewritten programs in order to clarify comparability. Tables A-1 to A-7 contain enrollment data in time series. In each table, there are two presentations for 1986. The original was from the edit and tabulation package used for this data series from 1967 to 1986. The revised version (1986R) will be used from 1987 until a new tabulation package is written.

Major changes in the data due to the edit revisions are:

a. Among 14- and 15-year-olds, an edit improvement allowed persons with enrollment data not reported who were previously automatically imputed "not enrolled" to be enrolled.

b. Revisions in tabulation of enrollment in the previous year simplifies calculation of an annual high school dropout rate.

c. Edit improvements caused increases in college enrollment estimates, most notably above age 24; this age group was largely ignored in earlier edits.

d. Type of college is fully allocated (discussed earlier).

e. Tabulations of type of college are available by race.

f. Dependent family member is defined consistently.

g. New data on employment status, vocational course enrollment, college retention and re-entry, and families with children enrolled in public and private school are available.

In the series of reports on school enrollment for 1987 to 1992, race and Hispanic origin were erroneously tabulated for a small percentage of children 3 to 14 years old. Race and Hispanic origin of an adult in the household were attributed to the child, rather than using the child's reported characteristics. In the vast majority of cases these characteristics were the same for family members, but for a small percentage of children, they were different. The correction made the following proportional changes in the numbers of children in each group: White (-0.5 percent), Black (+3.1 percent), Hispanic origin (-4.6 percent).

Age. The age classification is based on the age of the person at his/ her last birthday.

Race. The population is divided into three groups on the basis of race—White, Black, and other races. The last category includes American Indians, Japanese, Chinese, other Asian and Pacific Islanders, and any other race except White and Black. In this report, other races is not shown separately.

Hispanic origin. Information on origin or descent was obtained by asking, "What is (this person's) origin or descent?" Responses generally refer to a person's perceived national or ethnic lineage and do not necessarily indicate the country of his/ her birth or that of his/ her parents.

Persons of Hispanic origin are persons who reported themselves as Mexican American, Chicano, Mexican, Mexicano, Puerto Rican, Cuban, Central or South American, or other Hispanic origin. However, all persons who reported themselves as Mexican American, Chicano, Mexican, or Mexicano were combined into the one category—Mexican. Persons of Hispanic origin may be of any race.

Marital status. The marital status category shown in this report, "married, spouse present," includes persons who are currently married and living with their spouse. The category "never married" is self-explanatory. The category "other marital status" includes persons who are separated, divorced, or widowed.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is direct access from the outside or through a common hall.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Family. A family (also referred to in this publication as a primary family) is a group of two persons or more (one of whom is the householder), related by birth, marriage, or adoption and residing together; all such persons are considered members of one family.

Householder. The householder refers to the person (or one of the persons) in whose name the housing unit is owned or rented (maintained) or, if there is no such person, any adult member, excluding roomers, boarders, or paid employees. If the house is owned or rented jointly by a married couple, the householder may be either the husband or the wife. The person designated as the householder is the "reference person" to whom the relationship of all other household members, if any, is recorded.

Prior to 1980, the husband was always considered the householder in married-couple households. The number of householders is equal to the number of households. Also, the number of family householders is equal to the number of families.

Family householder. The family member who is also the householder (the person or one of the persons who maintain the household), or reference person, is the family householder.

Head versus householder. Beginning with the 1980 census, the Bureau of the Census discontinued the use of the terms "head of household" and "head of family." Instead, the terms "householder" and "family householder" were used. Recent social changes resulted in greater sharing of household responsibilities among the adult members and, therefore, made the term "head" inappropriate in the analysis of household and family data. Specifically, the Bureau reconsidered its longtime practice of always classifying the husband as the reference person (head) when he and his wife are living together.

In this report, the term "householder" is used in the presentation of data that had previously been presented with the designation "head." The householder is the first adult household member listed on the questionnaire. The instructions call for listing first the person (or one of the persons) in whose name the home is owned or rented. If a home is owned jointly by a married couple, either the husband or the wife may be listed first, thereby becoming the reference person, or householder, to whom the relationship of other household members is to be recorded.

The practice of using the term "head of family" or "family head", to refer to the person maintaining the household, was discontinued in CPS surveys conducted after the 1980 Census of Population. In surveys taken prior to the 1980 Census of Population, husbands in husband-wife families were always classified as "family heads." Women were only "family heads" if no spouse was present. The person who maintains the household is now called the "family householder."

Dependent family member. In theory, a dependent family member is one who is financially dependent on the householder. In these data a dependent family member is a primary family member, under 25 years old, who is an own child, brother/sister, or other relative (not parent) of the householder, and is not "married, spouse present."

In analyses of data on college enrollment by family income for earlier years, persons who were primary family members, 18 to 24 years old, and not "married, spouse present" were often treated as dependent family members, although not labelled as such and including some householders (e.g. "other marital status" in table 13 of CPR Series P-20, No. 429.) The family income reported for dependent family members is presumed to be that of the parental family; for others, it is presumed to be that of the individual and his/her spouse. In table 15, persons labeled "dependent family member" and "other marital and family status" combined are equivalent to persons labeled "other marital status" in table 13 of CPR Series P-20, No. 429. Persons who are "other marital and family status" in this report are the family householders who are not "married, spouse present."

Educational Attainment. Data on educational attainment are derived from a single question that asks, "What is the highest level of school ... has completed, or the highest degree ... has received?" Levels of completion beyond a high school degree are identified with specific categories, such as associate, bachelors and masters, for example.The question on educational attainment applies only to progress in "regular" schools. Such schools include public, private and parochial elementary and high schools (both junior and senior), colleges, universities and professional schools (whether day or night schools). Thus, regular schooling is that which may advance a person toward an elementary school certificate, a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools is counted only if the credits obtained are regarded as transferable to schools in the regular school system.

The single educational attainment question now in use was introduced in the CPS beginning January 1992, and is similar to that used in the 1990 Decennial Census of Population and Housing. Consequently, data on educational attainment from the 1993 CPS are not directly comparable to CPS data from earlier years. The new question replaces the previous two-part question used in the CPS that asked respondents to report the highest grade they had atended, and whether or not they had completed that grade.

Labor force status.

In the labor force. The definition of labor force and employment status relates to the population 15 years old and over. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. Data tabulated from the October CPS are for the civilian population only.

Not in the labor force. All civilians who are not classified as employed or unemployed are defined as "not in the labor force."

Employed. Employed persons comprise (1) all civilians who, during the survey week containing October 12, did any work at all as paid employees or in their own business or profession, on their own farm, or in a business operated by a member of the family and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework and painting or repairing own home) or volunteer work for religious, charitable, and similar organizations

Unemployed. Unemployed persons are those civilians who, during the survey week had no employment but were available for work and (1) had engaged in any specific jobseeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off, or (3) were waiting to report to a new wage or salary job within 30 days.

Full-time and part-time employment. Persons who worked 35 hours or more during the survey week and those who worked 1 to 34 hours but usually work full time are classified as employed full time. Part-time workers are persons who worked 1 to 34 hours during the survey week and usually work only 1 to 34 hours. Persons with a job but not at work during the survey week are classified according to whether they usually work full time or part time.

Family Income. In this report, family income is derived from a single question asked of the household respondent when a household first enters the sample and is updated on the 1-year anniversary of entry. Income includes money income from jobs; net income from business, farm, or rent; pensions; dividends; interest; social security payments; and any other money income. The income of nonrelatives living in the household is excluded, but the income of all family members 14 years old and over, including those temporarily living away, is included. It should be noted that while characteristics of the person, such as age and marital status, and the composition of families refer to the date of the interview, family income statistics refer to receipts over a 12-month period starting 12 to 16 months prior to the interview.

The income tables include in the lowest income group those who were classified as having no income in the 12-month reference period and those reporting a loss in net income from farm and nonfarm self-employment or in rental income.

The detailed income tables include a separate category ("not reported") for families for which no income information was obtained. In most other CPS's showing income data, the missing income data have been allocated.

The money income level of families shown in this report may be somewhat understated. Income data from the October control card are based on the respondent's estimate of total family money income in broad, fixed income intervals. Income data collected in the March

supplement to the CPS are based on responses to 11 direct questions asked about each person 15 years old and over and identifying 23 different sources of income in the preceding calendar year. Previous research has shown that the use of broad income intervals to record money income tends to reduce the rate of nonresponse, while increasing the likelihood that the amounts reported will be significantly understated as compared with results from more detailed questions.

Metropolitan-nonmetropolitan residence. The population residing in metropolitan statistical areas (MSA's) constitutes the metropolitan population. MSA's are defined by the Office of Management and Budget for use in the presentation of statistics by agencies of the Federal Government. An MSA is a geographic area consisting of a large population nucleus, together with adjacent communities which have a high degree of economic and social integration with that nucleus. The definitions specify a boundary around each large city so as to include most or all its suburbs. Entire counties form the MSA building blocks, except in New England where cities and towns are used. The former term, SMSA, was changed to MSA in 1983.

An area qualifies for recognition as an MSA if (1) it includes a city of at least 50,000 population, or (2) it includes a Census Bureau-defined urbanized area of at least 50,000 with a total metropolitan population of at least 100,000 (75,000 in New England). In addition to the county containing the main city or urbanized area, an MSA may include other counties having strong commuting ties to the central county. If specified conditions are met, certain large MSA's are designated as consolidated MSA's (CMSA's) and divided into component primary MSA's (PMSA's).

Central cities. The largest city in each MSA is always designated a central city. There may be additional central cities if specified requirements, designed to identify places of central character within the MSA, are met. Although the largest central cities are generally included in the title of the MSA, there may be central cities that are not part of the title. The balance of the MSA outside the central city or cities often is regarded as equivalent to "suburbs."

In July 1985, the CPS began carrying the metropolitan statistical area definitions announced by the Office of Management and Budget on June 30, 1984. Figures published from the CPS in the early 1980's and throughout most of the 1970's referred to metropolitan areas as defined on the basis of the 1970 census. Since there are important differences in the population classified as metropolitan using the 1970 and 1984 definitions, comparisons should be avoided.

Comparability of metropolitan estimates. The new CPS metropolitan estimates have consistently been higher than independent estimates of the metropolitan population prepared by the Census Bureau; the new CPS nonmetropolitan estimates have been lower than the independent estimates. For example, between July 1985 and August 1986, the magnitude of the monthly differences varied from 900,000 to 2.5 million persons, so that the proportion of the population living in metropolitan areas according to the CPS has ranged from 0.4 to 1.0 percentage points higher than the independent estimate. The difference in level between the two sets of estimates is partially attributable to the basic CPS sample design, which, because of sampling variability, includes an oversample of metropolitan households and an undersample of nonmetropolitan households. The monthly variations result from the exit and entrance of rotation groups, each with slightly different metropolitan-nonmetropolitan pro portions, into the sample. The apparent overestimation of metropolitan and underestimation of nonmetropolitan population in the CPS relative to the Bureau's independent estimates should be taken into account when using the data.

Geographic regions. The four major regions of the United States, for which data are presented, represent groups of States, as follows:

Northeast— Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.

Midwest[1]*—Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.*

South— Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

West— Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

Symbols. The following symbols are used throughout the tables:

-	Represents zero or rounds to zero.
B	The base of the derived figure is less than 75,000.
X	Not applicable
NA	Not available.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals which are independently rounded. With few exceptions, percentages are based on the rounded absolute numbers.

[1]Formerly North Central.

Appendix C. Source and Accuracy of Estimates

SOURCE OF DATA

Most estimates in this report come from data obtained in October 1993 from the Current Population Survey (CPS). Some estimates are based on data obtained from the CPS in earlier years. The Bureau of the Census conducts the survey every month, although this report uses only October data for its estimates. The October survey uses two sets of questions, the basic CPS and the supplement.

Basic CPS. The basic CPS collects primarily labor force data about the civilian noninstitutional population. Interviewers ask questions concerning labor force participation about each member 15 years old and over in every sample household.

The present CPS sample was selected from the 1980 Decennial Census files with coverage in all 50 states and the District of Columbia. The sample is continually updated to account for new residential construction. It is located in 729 areas comprising 1,973 counties, independent cities, and minor civil divisions. About 60,000 occupied households are eligible for interview every month. Interviewers are unable to obtain interviews at about 2,600 of these units because the occupants are not found at home after repeated calls or are unavailable for some other reason.

Since the introduction of the CPS, the Bureau of the Census has redesigned the CPS sample several times to improve the quality and reliability of the data and to satisfy changing data needs. The most recent changes were completely implemented in July 1985.

Table C-1 summarizes changes in the CPS designs for the years for which data appear in this report.

October Supplement. In addition to the basic CPS questions, interviewers asked supplementary questions in October about school enrollment for all household members 3 years old and over.

Estimation Procedure. This survey's estimation procedure inflates weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, sex, race, and Hispanic/non-Hispanic categories. The independent estimates were based on statistics from decennial censuses of population; statistics on births, deaths, immigration and emigration; and statistics on the size of the Armed Forces.

Table C-1. **Description of the Current Population Survey**

Time Period	Number of sample areas	Housing units eligible	
		Interviewed	Not Interviewed
1990 to 1993	729	57,400	2,600
1988 to 1989	729	53,600	2,500
1985 to 1987	729	57,000	2,500
1984	629/729[1]	57,000	2,500
1981 to 1983	629	59,000	2,500
1980	629	65,500	3,000
1978 to 1979	614	55,000	3,000
1972 to 1977	461	46,500	2,500
1971	449	45,000	2,000
1967 to 1970	449	48,000	2,000
1963 to 1966	357	33,500	1,500
1960 to 1962	333	33,500	1,500
1957 to 1959	330	33,500	1,500
1954 to 1956	230	21,000	500-1,000
1947 to 1953	68	21,000	500-1,000

[1]The CPS was redesigned following the 1980 Decennial Census of Population and Housing. During phase-in of the new design, housing units from the new and old designs were in the sample.

The independent population estimates used for 1981 to present were based on updates to controls established by the 1980 Decennial Census. Before 1981, independent population estimates from the most recent decennial census were used. For more details on the change in independent estimates, see the section entitled "Introduction of 1980 Census Population Controls" in an earlier report (Series P60, No. 133).

The estimates in this report for 1985 and later also employ a revised survey weighting procedure for persons of Hispanic origin. In previous years, weighted sample results were inflated to independent estimates of the noninstitutional population by age, sex, and race. There was no specific control of the survey estimates for the Hispanic population. Since then, the Bureau of the Census developed independent population controls for the Hispanic population by sex and detailed age groups. Revised weighting procedures incorporate these new controls. The independent population estimates include some, but not all, undocumented immigrants.

ACCURACY OF THE ESTIMATES

Since the CPS estimates come from a sample, they may differ from figures from a complete census using the same questionnaires, instructions, and enumerators. A sample survey estimate has two possible types

of errors: sampling and nonsampling. The accuracy of an estimate depends on both types of errors, but the full extent of the nonsampling error is unknown. Consequently, one should be particularly careful when interpreting results based on a relatively small number of cases or on small differences between estimates. The standard errors for CPS estimates primarily indicate the magnitude of sampling error. They also partially measure the effect of some nonsampling errors in responses and enumeration, but do not measure systematic biases in the data. (Bias is the average over all possible samples of the differences between the sample estimates and the desired value.)

Nonsampling Variability. There are several sources of nonsampling errors including the following:

- Inabililty to get information about all sample cases.
- Definitional difficulties.
- Differences in interpretation of questions.
- Respondents' inability or unwillingness to provide correct information.
- Respondents' inability to recall information.
- Errors made in data collection, such as in recording and coding the data.
- Errors made in processing the data.
- Errors made in estimating values for missing data.
- Failure to represent all units with the sample (undercoverage).

CPS undercoverage results from missed housing units and missed persons within sample households. Compared with the level of the 1980 Decennial Census, overall CPS undercoverage is about 7 percent. CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. As described previously, ratio estimation to independent age-sex-race-Hispanic population controls partially corrects for the bias due to undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics from those of interviewed persons in the same age-sex-race-Hispanic group. Furthermore, the independent population controls have not been adjusted for undercoverage in the 1980 census.

A common measure of survey coverage is the coverage ratio, the estimated population before ratio adjustment divided by the independent population control. Table C-2 shows CPS coverage ratios for age-sex-race groups for a recent month. The CPS coverage ratios can exhibit some variability from month to month, but these are a typical set of coverage ratios. Other Census Bureau household surveys experience similar coverage.

Table C-2. **CPS Coverage Ratios**

Age	Non-Black		Black		All persons		
	M	F	M	F	M	F	Total
0 to 14 years	0.948	0.960	0.913	0.930	0.943	0.955	0.949
15 years	0.953	0.986	0.975	1.025	0.956	0.993	0.974
16 years	0.877	0.997	0.886	0.963	0.879	0.991	0.934
17 years	0.958	0.956	0.860	0.932	0.942	0.952	0.947
18 years	0.950	0.958	0.931	0.692	0.947	0.916	0.931
19 years	0.882	0.953	0.773	0.740	0.866	0.920	0.893
20 to 24 years	0.889	0.918	0.645	0.820	0.856	0.904	0.881
25 to 26 years	0.867	0.964	0.687	0.820	0.844	0.943	0.894
27 to 29 years	0.919	0.941	0.700	0.834	0.892	0.926	0.909
30 to 34 years	0.884	0.947	0.667	0.865	0.859	0.936	0.898
35 to 39 years	0.892	0.936	0.693	0.928	0.871	0.935	0.903
40 to 44 years	0.895	0.933	0.781	0.889	0.884	0.928	0.906
45 to 49 years	0.933	0.955	0.842	0.938	0.925	0.953	0.939
50 to 54 years	0.953	0.958	0.845	0.869	0.942	0.948	0.945
55 to 59 years	0.918	0.905	0.797	0.906	0.906	0.905	0.905
60 to 62 years	0.926	0.874	0.702	0.779	0.904	0.864	0.883
63 to 64 years	0.851	0.960	0.814	0.944	0.848	0.959	0.906
65 to 67 years	0.891	0.945	0.785	0.991	0.881	0.950	0.918
68 to 69 years	0.876	0.986	0.741	0.810	0.864	0.970	0.922
70 to 74 years	0.955	1.020	0.866	0.949	0.948	1.014	0.985
75 to 99 years	0.983	1.019	0.713	0.861	0.962	1.006	0.990
15 years and over	0.911	0.951	0.752	0.877	0.893	0.942	0.919
0 years and over	0.919	0.953	0.802	0.891	0.905	0.945	0.926

Note: These coverage ratios are for May 1993.

For additional information on nonsampling error including the possible impact on CPS data when known, refer to Statistical Policy Working Paper 3, *An Error Profile: Employment as Measured by the Current Population Survey*, Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978 and Technical Paper 40, *The Current Population Survey: Design and Methodology*, Bureau of the Census, U.S. Department of Commerce.

Comparability of Data. Data obtained from the CPS and other sources are not entirely comparable. This results from differences in interviewer training and experience and in differing survey processes. This is an example of nonsampling variability not reflected in the standard errors. Use caution when comparing results from different sources.

Caution should also be used when comparing estimates in this report (which reflect 1980 census-based population controls) with estimates for 1980 and earlier years (which reflect 1970 census-based population controls). This change in population controls had relatively little impact on summary measures such as means, medians, and percentage distributions. It did have a significant impact on levels. For example, use of 1980 based population controls results in about a 2-percent increase in the civilian noninstitutional population and in the number of families and households. Thus, estimates of levels for data collected in 1981 and later years will differ from those for earlier years by more than what could be attributed to actual changes in the population. These differences could be disproportionately greater for certain subpopulation groups than for the total population.

Since no independent population control totals for persons of Hispanic origin were used before 1985, compare Hispanic estimates over time cautiously.

Note When Using Small Estimates. Summary measures (such as medians and percentage distributions) are shown only when the base is 75,000 or greater. Because of the large standard errors involved, summary measures would probably not reveal useful information when computed on a smaller base. However, estimated numbers are shown even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates permit combinations of the categories to suit data users' needs. These estimates may not be reliable for the interpretation of small differences. For instance, even a small amount of nonsampling error can cause a borderline difference to appear significant or not, thus distorting a seemingly valid hypothesis test.

Sampling Variability. Sampling variability is variation that occurred by chance because a sample was surveyed rather than the entire population. Standard errors, as calculated by methods described next, are primarily measures of sampling variability, although they may include some nonsampling errors.

Standard Errors and Their Use. A number of approximations are required to derive, at a moderate cost, standard errors applicable to all the estimates in this report. Instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. Thus, the tables show levels of magnitude of standard errors rather than the precise standard errors.

Tables C-3 and C-4 provide standard errors of estimated numbers. Table C-5 provides standard errors of estimated precentages. Table C-6 has standard error parameters for persons, families, households, householders, and unrelated individuals. Table C-6 also provides factors to apply to the standard errors in tables C-3 through C-5. Table C-7 has factors for years prior to 1990. Table C-8 has factors for regional data.

The sample estimate and its standard error enable one to construct a confidence interval. A confidence interval is a range that would include the average result of all possible samples with a known probability. For example, if all possible samples were surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then approximately 90 percent of the intervals from 1.645 standard errors below the estimate to 1.645 standard errors above the estimate would include the average result of all possible samples.

A particular confidence interval may or may not contain the average estimate derived from all possible samples. However, one can say with specified confidence that the interval includes the average estimate calculated from all possible samples.

Some statements in the report may contain estimates followed by a number in parentheses. This number can be added to and subtracted from the estimate to calculate upper and lower bounds of the 90-percent confidence interval. For example, if a statement contains the phrase "grew by 1.7 percent ($\pm$1.0)," the 90-percent confidence interval for the estimate, 1.7 percent, is 0.7 percent to 2.7 percent.

Standard errors may be used to perform hypothesis testing. This is a procedure for distinguishing between population characteristics using sample estimates. The most common type of hypothesis appearing in this report is that the population characteristics are different. An example of this would be comparing the percentage of 18 to 24 year olds enrolled in college in 1993 to those enrolled in 1983.

Tests may be performed at various levels of significance. The significance level of a test is the probability of concluding that the characteristics are different when, in fact, they are the same. All statements of comparison

in the text have passed a hypothesis test at the 0.10 level of significance or better. This means that the absolute value of the estimated difference between characteristics is greater than or equal to 1.645 times the standard error of the difference.

Standard Errors of Estimated Numbers. There are two ways to compute the approximate standard error, s_x, of an estimated number shown in this report. The first uses the formula

$$s_x = fs \qquad (1)$$

where f is a factor from table C-6 and s is the standard error of the estimate obtained by interpolation from table C-3 or C-4. The second method uses formula (2), from which the standard errors in tables C-3 and C-4 were calculated. This formula will provide more accurate results than formula (1).

$$s_x = \sqrt{-(b/T)x^2 + bx} \qquad (2)$$

Here x is the size of the estimate, T is the total number of persons in a specific age group and b is the parameter in table C-6 associated with the particular type of characteristic. If T is not known, for Total or White use 100,000,000; for Blacks and Hispanic use 10,000,000. When calculating standard errors for numbers from cross-tabulations involving different characteristics, use the factor or set of parameters for the characteristic which will give the largest standard error.

Illustration. Table 1 shows there are 3,275,000 3 and 4 year olds enrolled in school and 8,097,000 children in that age group. Use the appropriate parameter from table C-6 and formula (2) to get

Number, x	3,275,000
Total, T	8,097,000
b parameter	2,882
Standard error	75,000
90% conf. int.	3,152,000 to 3,398,000

The standard error is calculated as

$$s_x = \sqrt{(2{,}882 \div 8{,}097{,}000) \times 3{,}275{,}000^2 + 2{,}882 \times 3{,}275{,}000} = 75{,}000$$

The 90-percent confidence interval is calculated as 3,275,000 $\pm$ 1.645 x 75,000.

A conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

The alternate calculation of the standard error, using formula (1) with f = 1.1 from table C-6 and s = 66,000 by interpolation from table C-3 is

$$s_x = 1.1 \times 66{,}000 = 73{,}000$$

Standard Errors of Estimated Percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on the size of the percentage and its base. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameter from table C-6 indicated by the numerator.

The approximate standard error, $s_{x,p}$, of an estimated percentage can be obtained by use of the formula

$$s_{x,p} = fs \qquad (3)$$

In this formula, f is the appropriate factor from table C-6, and s is the standard error of the estimate obtained by interpolation from table C-5.

Alternatively, formula (4) will provide more accurate results. The standard errors in Table C-5 were calculated with this formula.

$$s_{x,p} = \sqrt{\frac{b}{x} p(100 - p)} \qquad (4)$$

Here x is the total number of persons, families, households, or unrelated individuals in the base of the percentage, p is the percentage ($0 \leq p \leq 100$), and b is the parameter in table C-6 associated with the characteristic in the numerator of the percentage.

Illustration. Table 1 shows that of the 13,169,000 persons aged 18 to 21, 43.0 percent were enrolled in college in 1993. Use the appropriate parameter from table C-6 and formula (4) to get

Percentage, p	43.0
Base, x	13,169,000
b parameter	2,532
Standard error	0.7
90% conf. int.	41.8 to 44.2

The standard error is calculated as

$$s_{x,p} = \sqrt{\frac{2{,}532}{13{,}169{,}000} (43.0)(100.0 - 43.0)} = 0.7$$

The 90-percent confidence interval for the estimated percentage of persons aged 18 to 21 in 1992 enrolled in college is calculated as 43.0 $\pm$ 1.645 x 0.7.

The alternate calculation of the standard error, using formula (3), with f = 1.0 from table C-6 and s = 0.7 by interpolation from table C-5, is

$$s_{x,p} = 1.0 \times 0.7 = 0.7$$

Standard Error of a Difference. The standard error of the difference between two sample estimates is approximately equal to

$$s_{x-y} = \sqrt{s_x^2 + s_y^2} \qquad (5)$$

where s_x and s_y are the standard errors of the estimates, x and y. The estimates can be numbers, percentages, ratios, etc. This will represent the actual standard error quite accurately for the difference between estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. However, if there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustration. Table 1 shows that of the 57,336,000 males 35 years old and over, 1.5 percent were enrolled in college and of the 64,870,000 females of the same age group, 2.5 percent were enrolled in college. Use the appropriate parameters from table C-6 and formulas (2) and (4) to get

	x	y	difference
Percentage	1.5	2.5	1.0
Base	57,336,000	64,870,000	-
b parameter	2,532	2,532	-
Standard error	0.1	0.1	0.1
90% conf. int.	1.3 to 1.7	2.3 to 2.7	0.8 to 1.2

The standard error of the estimated differences calculated as

$$s_{x-y} = \sqrt{(0.1)^2 + (0.1)^2} = 0.1$$

The 90-percent confidence interval around the difference is calculated as $1.0 \pm 1.645 \times 0.1$. Since the interval does not contain zero, we can conclude with 90-percent confidence that the proportion of females aged 35 and over enrolled in college is greater than that for males.

Table C-3. **1993 Standard Errors of Estimated Numbers: Total or White**

(Numbers in thousands)

Size of estimate	Total persons in age group									
	100	250	500	1,000	2,500	5,000	10,000	25,000	50,000	100,000

Note: For a particular characteristic, see table C-6 for the appropriate factor to apply to the above standard errors.

Table C-6. 1993 Standard Error Parameters and Factors

Characteristic	Total or White		Black or other races		Hispanic	
	b	f	b	f	b	f
Persons Enrolled in School:						
Total	2,532	1.0	3,425	1.0	5,772	1.0
Children 13 and under	2,882	1.1	2,882	0.9	2,882	0.7
Marital Status	4,786	1.4	6,865	1.4	11,570	1.4
Household Characteristics:						
Head, wife, or primary individual	1,899	0.9	1,716	0.7	2,892	0.7
Child or other relative in primary family, Secondary family member	4,786	1.4	6,865	1.4	11,570	1.4
Income, earnings	2,485	0.9	2,485	0.9	2,234	0.6
Employment Status, Occupation:						
Both sexes	2,485	1.0	2,485	0.9	2,234	0.4
Male	2,150	0.9	2,150	0.6	2,150	0.4
Female	1,843	0.9	1,843	0.7	1,843	0.6

Notes: To estimate standard errors for school enrollment prior to 1990 multiply the b parameter for 1993 by the appropriate factor in table C-7. The parameters for 1990 through 1993 are the same. The b parameters should be multiplied by 1.5 for nonmetropolitan residence categories. The b parameters should be multiplied by 1.91 for farm characteristics. The b parameters should be multiplied by the factors in table C-8 for regional data.

Table C-7. Factors to Calculate b Parameters Prior to 1990

Year	Total or White	Black or other races	Hispanic
1988-1989	1.08	1.08	1.30
1985-1987	0.91	0.91	0.93
1982-1984	0.91	0.91	0.77
1977-1981	0.82	0.82	0.68
1967-1976	0.80	0.80	0.67
1957-1966	1.22	1.22	(X)
Before 1956	1.83	1.83	(X)

Notes: Apply the appropriate factor to the b parameter for 1993. The parameters for 1990 through 1993 are the same. Use the Total or White factors to calculate standard errors for children 13 and under.

X Not applicable

Table C-8. Regional Factors to Apply to 1993 b Parameters

Characteristic	Factor
U.S. Totals	1.00
Region	
Northeast	0.74
Midwest	0.98
South	1.04
West	1.06
